

Step 1 — Create Python Script

Create:

stock_check.py

Purpose:

- Read inventory data
 - Filter low-stock items
 - Export CSV report
-

Step 2 — Logic Inside Python Script

The script:

Read inventory data

Check reorder condition

Filter low-stock products

Export reorder_report.csv

Step 3 — Example Business Logic

Condition:

current_stock < reorder_level

If true:

Needs reorder

Step 4 — Export Low-Stock Report

Python creates:

reorder_report.csv

Example:

product_id	product_name	current_stock	reorder_level
P101	Laptop	5	10
P103	Keyboard	7	15

Step 5 — Push Files to Repository

Store project files in:

- Azure Repos

Files:

stock_check.py
azure-pipelines.yml
inventory.csv

Step 6 — Create Azure DevOps Project

Inside Azure DevOps:

Organization

New Project

Example:

- Inventory Management System
-

Step 7 — Create Pipeline

Go to:

Pipelines

↓
New Pipeline

Choose:

- GitHub repo
 - OR
 - Azure Repos
-

Step 8 — Configure YAML Pipeline

Azure DevOps uses:

azure-pipelines.yml

This file defines:

- What to run
 - When to run
 - Which script to execute
-

Step 9 — Pipeline Workflow

Pipeline Triggered

↓
Install Python
↓
Run stock_check.py
↓
Generate CSV
↓
Store Artifact

Step 10 — Schedule Daily Automation

Pipeline can run:

Trigger	Meaning
---------	---------

Manual	User clicks Run
Scheduled	Daily automatic run
Event-based	Trigger on code change

For your project:

Daily scheduled pipeline

Step 11 — Daily Report Generation

Pipeline automatically generates:

reorder_report.csv

This becomes your:

- Daily stock report
 - Reorder alert file
-

Step 12 — Store Pipeline Artifacts

Azure DevOps stores generated files as:

Artifacts

Meaning:

- Downloadable output files
